

OSI Model vs. TCP/IP Model

Cisco 3-Layer Hierarchical Model

- Core - Backbone**, common to all users, needs to be as fast as possible and fault tolerant, avoid ACL, VLAN trunking and packet filtering here.
- Distribution - Routing** - provides access control policies, filtering, WAN access and VLAN trunking
- Access - Switching** - User and workgroup access, segmentation

Patch Cable Types

- Straight-through** - Connect PC to hub or switch (router to switch or hub)
- Crossover** - Connect hub to hub/ switch to switch/PC to PC
- Rolled** - Console connection for PC to router

Half Duplex Ethernet shares a collision domain resulting in lower throughput than **Full Duplex Ethernet** which requires a point-to-point link between two compatible nodes

Causes of LAN congestion - Broadcast storms, too many hosts with a broadcast domain, multicasting, low bandwidth, bottlenecks

Collision domain - Switches/bridges breakup collision domains, hubs extend them

Broadcast domains - Routers and VLANs breakup broadcast domains

Troubleshooting Steps

1. Ping loopback
2. Ping NIC
3. Ping default gateway
4. Ping remote device
